Foundations of Audio Signal Processing Assignment 4

Giulia Baldini, Luis Fernandes, Agustin Vargas Toro November 17, 2018

Exercise 4.1

$$\|\sum_{j=1}^{n} x_j\|^2 = \langle \sum_{j=1}^{n} x_j, \sum_{j=1}^{n} x_j \rangle \text{ Scalar product norm definition}$$

$$= \sum_{j=1}^{n} \langle x_j, x_j \rangle \text{ Linearity of scalar product}$$

$$= \sum_{j=1}^{n} \|x_j\|^2 \text{ Scalar product norm definition}$$

Exercise 4.2

a.
$$d(x,y) = |x-y|$$

Let $x = a_1 + b_1 i, y = a_2 + b_2 i, z = a_3 + b_3 i, \forall x, y, z \in \mathcal{C}$ then
$$|x-y| = \sqrt{(a_1 + b_1)^2 - (a_2 + b_2)^2} = \sqrt{(a_1 - a_2)^2 + (b_1 - b_2)^2}$$

- 1. $\sqrt{(a_1-a_2)^2+(b_1-b_2)^2}\geq 0$ holds, as the square root of a positive number
- is always a positive number (resp. $\sqrt{0} = 0$) 2. $\sqrt{(a_1 a_2)^2 + (b_1 b_2)^2} = 0$ only if $a_1 = a_2$ and $b_1 = b_2$, which is the case when
- x = y.3. $\sqrt{(a_1 a_2)^2 + (b_1 b_2)^2} = \sqrt{(a_2 a_1)^2 + (b_2 b_1)^2}$ 4. $d(x, y) + d(y, z) = \sqrt{(a_1 a_2)^2 + (b_1 b_2)^2} + \sqrt{(a_2 a_3)^2 + (b_2 b_3)^2}$ According to Minkowsky Inequality:

$$\left(\sum_{k=1}^{n} |x_k + y_k|^p\right)^{\frac{1}{p}} \le \left(\sum_{k=1}^{n} |x_k|^p\right)^{\frac{1}{p}} + \left(\sum_{k=1}^{n} |y_k|^p\right)^{\frac{1}{p}}$$

If we consider the case with p=2 and n=2 (in our case $x_1=(a_1-a_2)$ and $x_2=(b_1-b_2)$ and similarly are y_1 and y_2 defined), then:

$$d(x,y) + d(y,z) \ge \sqrt{|x_1 + y_1|^2 + |x_2 + y_2|^2}$$

Since in our case $x_k, y_k \in \mathbb{R}$:

$$d(x,y) + d(y,z) \ge \sqrt{(a_1 - a_2 + a_2 - a_3)^2 + (b_1 - b_2 + b_2 - b_3)^2}$$

$$d(x,y) + d(y,z) \ge \sqrt{(a_1 - a_3)^2 + (b_1 - b_3)^2}$$
$$d(x,y) + d(y,z) \ge d(x,z)$$

b.
$$d(x, y) = |x| \cdot |y|$$

In this case the second property (d(x,y) = 0 iff x = y) does not hold because d(x,y) = 0 with x = 0 and y = 2 - 5i.

c.
$$d(x,y) = \begin{cases} 1 & x \neq y \\ 0 & \text{else} \end{cases}$$

 $\forall x, y, z \in \mathcal{C}$:

- 1. $d(x,y) \ge 0$ holds, because the possible values are 0, 1.
- 2. d(x,y) = 0 iff x = y holds for the definition of d(x,y).
- 3. d(x,y) = d(y,x) holds, because $x \neq y$ and $y \neq x$ are the same.
- 4. $d(x, z) \le d(x, y) + d(y, z)$ holds because if $x \ne y \ne z$ then $1 \le 1 + 1$. If $x = y \ne z$ then $1 \le 0 + 1$. If $x \ne y = z$ then $1 \le 1 + 0$. If $x = z \ne y$ then $0 \le 1 + 1$. If x = y = z then $0 \le 0 + 0$.

Exercise 4.3

a-b. The solutions can be found inside the code folder.

Exercise 4.4

a-b. The solutions can be found inside the code folder.
